

I1 extends I2

Program Code:

```
package core_java;

interface I2 {
    void msgI2();
}

interface I1 extends I2 {
    void msgI1();
}

class TestClass implements I1 {
    public void msgI2() {
        System.out.println("Message from I2");
    }

    public void msgI1() {
        System.out.println("Message from I1");
    }
}

public class I1toI2 {
    public static void main(String[] args) {
        TestClass obj = new TestClass();
        obj.msgI2();
        obj.msgI1();
    }
}
```

Explanation:

This program demonstrates interface inheritance. Interface I1 extends interface I2, so I1 inherits the msgI2() method from I2. The TestClass implements I1 and therefore provides implementations for both msgI1() and msgI2().

Compilation and Execution Commands:

Save the file as: I1toI2.java

Compile:
javac -d . I1toI2.java

Run:
java core_java.I1toI2

Output Screenshot:

Message from I2

Message from I1

Verification:

The output confirms that TestClass successfully implements I1 and provides the method from I1 as well as the inherited method from I2.

Result:

Thus, the Java program was successfully executed and the relationship I1 extends I2 was verified successfully.
